CareSteps | WorkBuddy development evidence

Tencent Cloud AI Singapore Hackathon 2026 - Healthcare Track

Recorded session: October 15, 2026. Packaged: October 16, 2026.

Task 1: Implement the consolidated GET /api/stats endpoint and regression tests.

Task 2: Write the Render / Railway single-instance deployment guide.

The following three pages contain the existing conversation screenshots in order:

1. Task request and source inspection in the WorkBuddy interface.
2. Changed files, the deployment guide and validation work.
3. Completion response, sample API result and the guide preview.

Only private local-path prefixes and one account display name were redacted.

Original images remain in the owner's local archive. No conversation was fabricated.

These screenshots document the two completed WorkBuddy tasks listed above.

See docs/development.md for the recorded workflow and verification process.

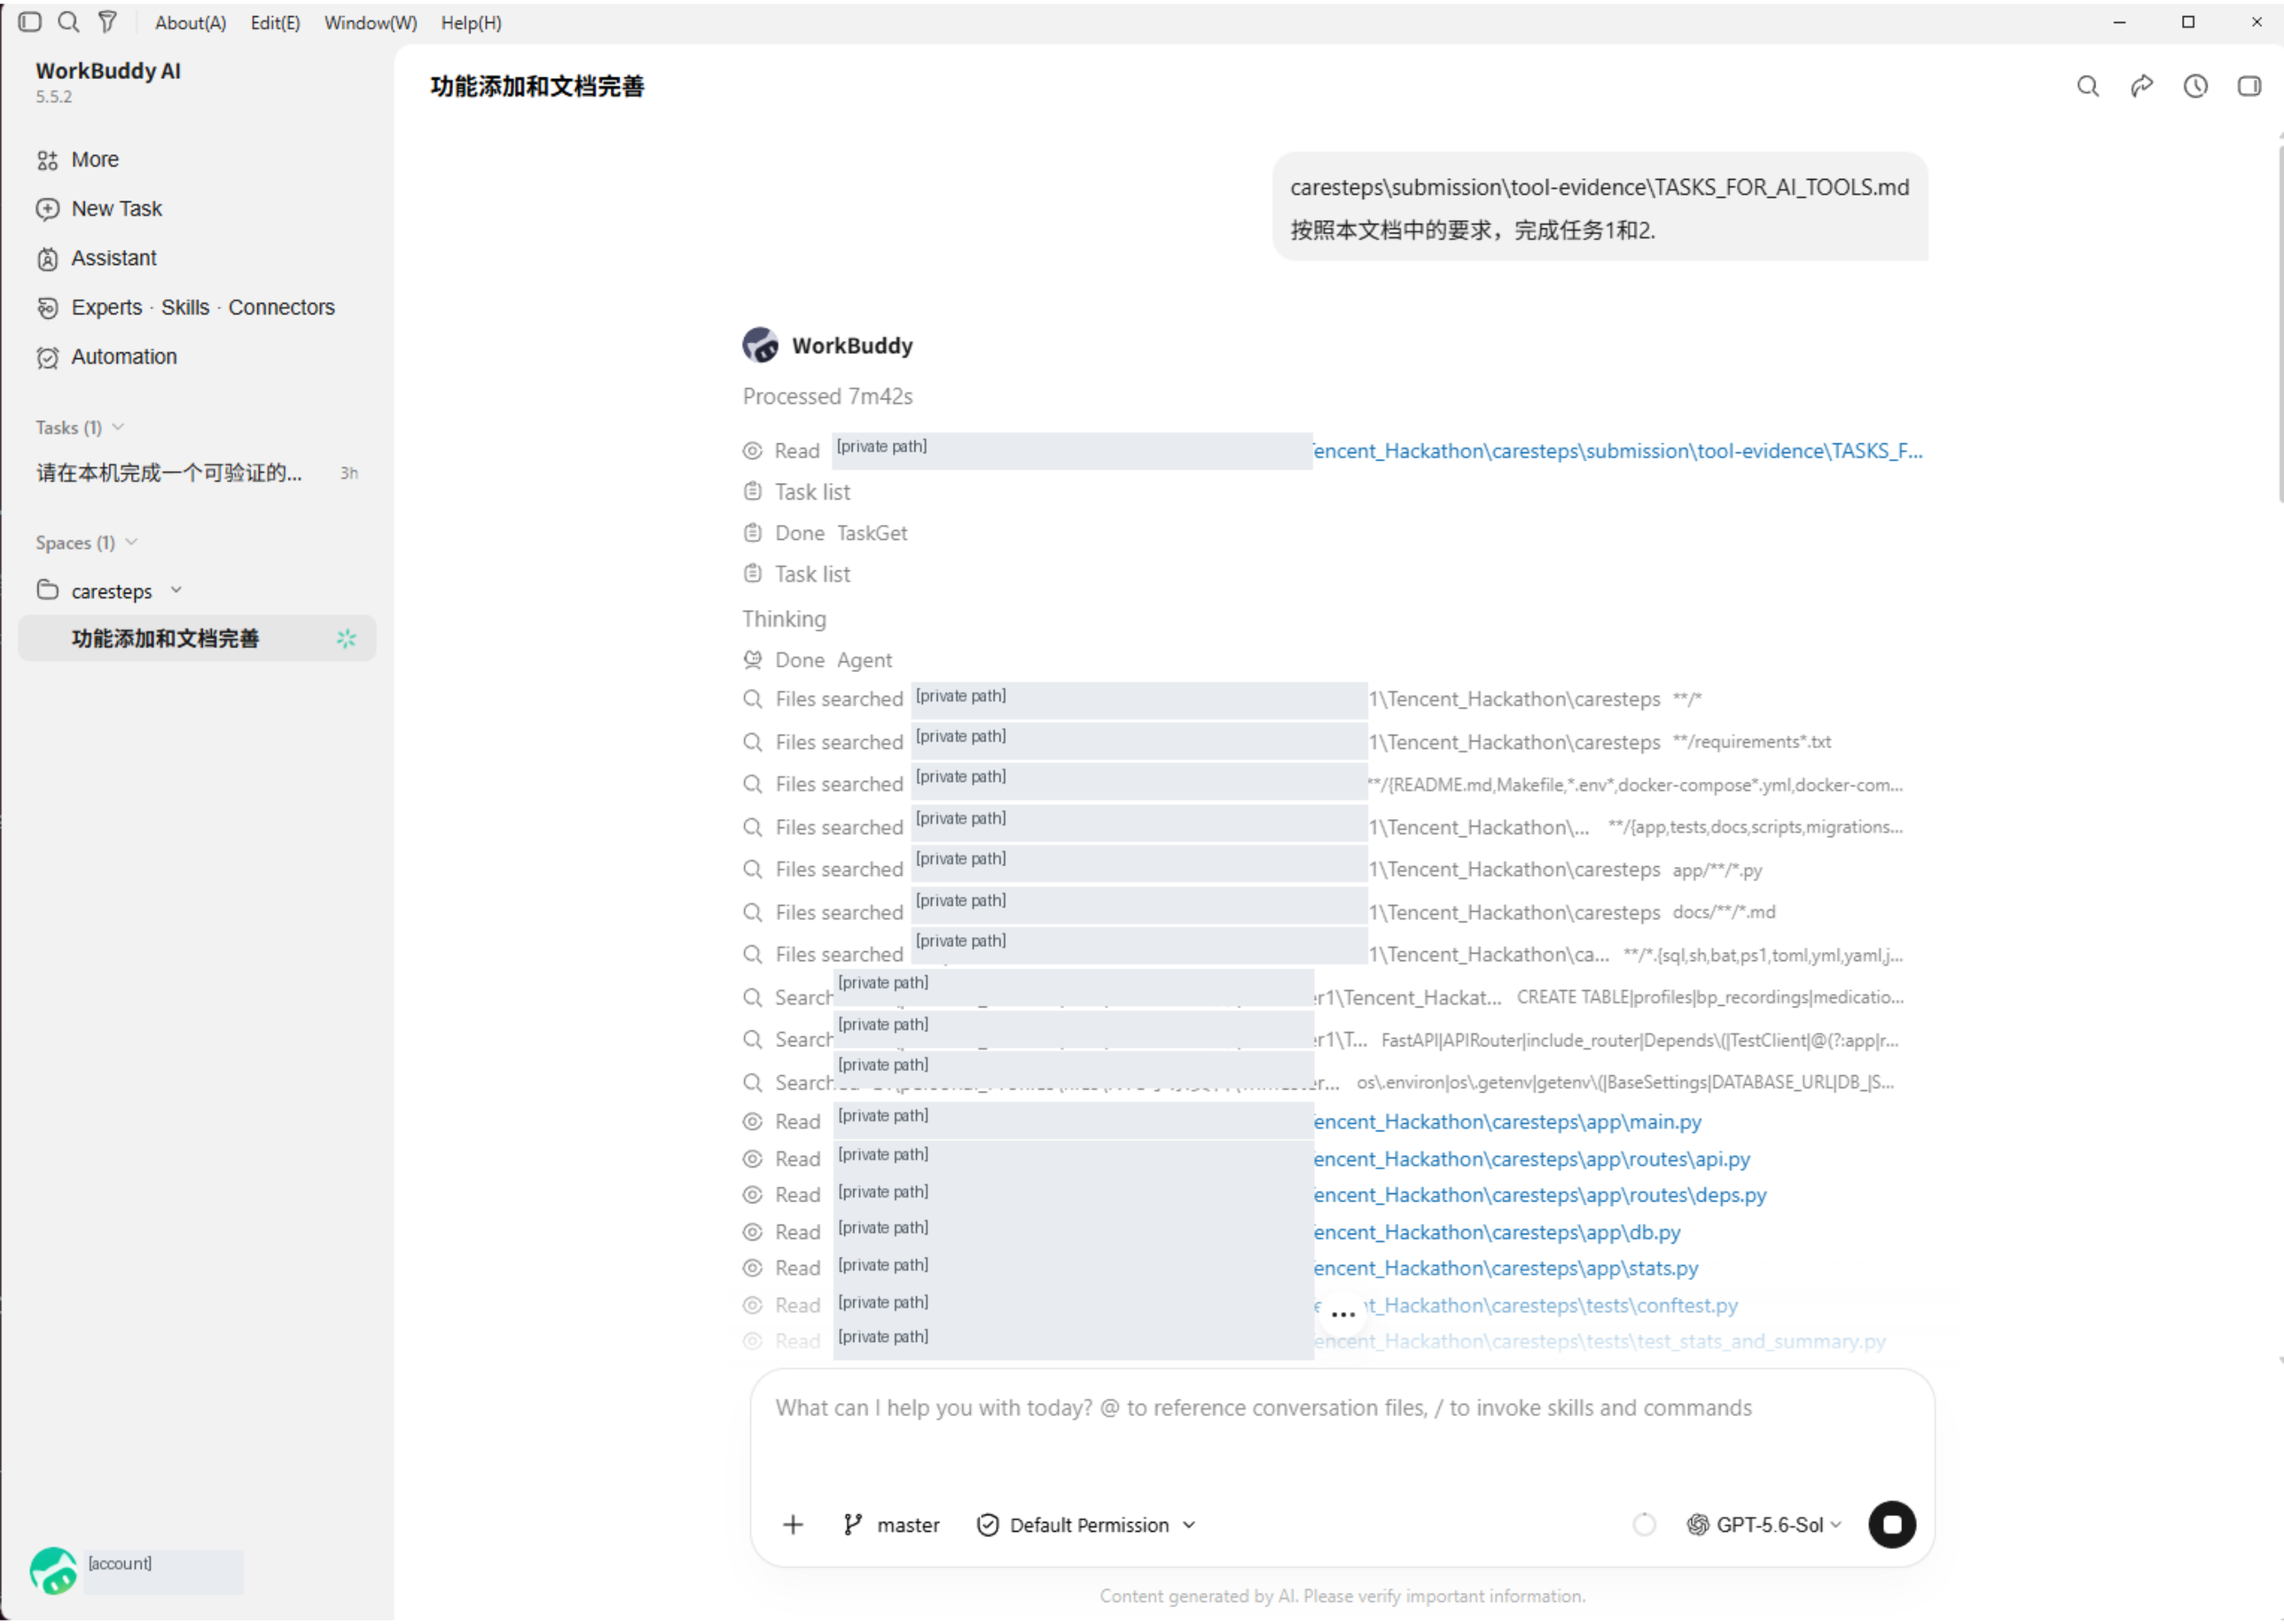

Historical task validation: 5 targeted tests and 170 full-suite tests passed.

Current release validation has 171 tests and 27 routing scenarios.

Software checks do not establish clinical validation or accessibility conformance.

功能添加和文档完善

caresteps\submission\tool-evidence\TASKS_FOR_AI_TOOLS.md
按照本文档中的要求，完成任务1和2.

WorkBuddy

Completed 41m59s >

任务 1 和任务 2已完成。

任务 1：系统统计 API

- 新增 `app/routes/stats.py`
- 在 `app/main.py` 注册路由
- 在 `app/repository.py` 增加统计查询
- 新增 `tests/test_system_stats_api.py`
- 实际请求结果：

json

```
{
  "total_users": 1,
  "total_bp_recordings": 11,
  "total_medications_tracked": 2,
  "active_barriers": 1,
  "database_size_kb": 176
}
```

项目原先已有 `/api/stats?days=14` 周期统计接口。为避免重复路由，现在：

- `/api/stats`：返回任务要求的系统指标
- `/api/stats?days=14`：继续返回原有周期统计，保持兼容

任务 2：部署指南

What can I help you with today? @ to reference conversation files, / to invoke skills and commands

DEPLOYMENT.md

CareSteps — Deployment Guide

This guide deploys CareSteps as a **single-instance competition demo** on Render or Railway. The application is a FastAPI service with a local SQLite database and no frontend build step.

> **Prototype status.** CareSteps is not a medical device, an emergency service, or a production authentication system. Deploy only fictional demo data. Do not use this configuration for real patient information.

1. What will be deployed

The service runs one command:

```
uvicorn app.main:app --host 0.0.0.0 --port $PORT
```

The important deployment constraints are:

- Run **one service instance, one replica, and one Uvicorn worker**.
- Store `caresteps.db` on a persistent volume, not the platform's ephemeral filesystem.
- Do not run `make run` in the cloud. It binds to `127.0.0.1`, enables reload, and does not use the platform-provided port.
- Do not run the seed command during every build or deploy. It deliberately replaces the database.

Prerequisites

Before starting, you need:

1. A Git repository containing this project.
2. An account on Render or Railway.
3. Python 3.11 for local verification. The pinned dependencies were verified with Python 3.11.7.
4. Optional model credentials only if you want the live conversational path. The rest of the application works in limited mode without a model.

2. Environment variables
